Biophys. Res. Commun. 161:851-858(1989).

-I- FUNCTION: Growth factor active in angiogenesis, vasculogenesis and endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFRI/Fit-1 and VEGFRI/Kdr receptors and to heparan sulfate and

J. Reprod. Fertil. 108:157-165(1996).

-I- FUNCTION: Growth factor active in angiogenesis, vasculogenesis and endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFRI/Fit-1 and VEGFRI/Kdr receptors and to heparan sulfate and

FUNCTION: Growth factor active in angiogenesis, vasculogenesis and endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFRI/Fit-1 and VEGFRZ/Kdr receptors and to heparan sulfate and vessels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         heparin (By similarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           MEDLINE=98035455; PubMed=9351807;
                                                                                                                                                                                                                                                                                                                                                                                                                                                          FUNCTION: Growth factor active in angiogenesis, vasculogenesis and endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the PEGFR1/Flt-1 and VEGFR2/Kdr receptors and to heparan sulfate and heparin. Neuropillin-1 binds isoforms VEGF-165 and VEGF-145.
SUBUNIT: Homodimer; disulfide-linked. Also found as heterodimer
                                                                                                                                                                                                          Name=VEGF189;
IsoId=P15692-2;
                                                                                                                                                                                                                                                                                                                               VEGF165 is more basic, has heparin-binding properties and, although a signicant proportion remains cell-associated, most ifreely secreted. VEGF189 is very basic; it is cell-associated after secretion and is bound avidly by heparin and the extracellular matrix, although it may be released as a soluble form by heparin, heparinase or plasmin.
                                                                                                                                                                                                                                                                                                                                                                                                                            with PlGF (By similarity).
SUBCELLULAR LOCATION: VEGF121 is acidic and freely
                                                                                                                                                                                                                                                                                                    Event=Alternative splicing; Named isoforms=7;

                                                                                                                                                                         liver. In kidney glomeruli, brain and 10-times more abundant than VEGF-190. DEVELOPMENTAL STAGE: VEGF-166 is exprupgraded during gastrulation. Express only from day 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      FUNCTION: Growth factor active in angiogenesis, vasculogenesis a endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFR1/Flt-1 and VEGFR2/Kdr receptors and to heparan sulfate and heparin (By similarity).
                                                                                                                                                                                                                                        IsoId=P52582-3; Sequence=VSP_004635, VSP_004636;
Note=Has been shown to exist only in quall so far;
TISSUE SPECIFICITY: Abundantly and equally expressed in hear
liver. In kidney glomeruli, brain and yolk sac, VEGF-166 is
                                                                                                                                                                                                                                                                                                                                                                                                                                      SUBUNIT: Homodimer; disulfide-linked. Also found with PlGF (By similarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FUNCTION: Essential for efficient processing of 16S rRNA. P part of the 30S subunit prior to or during the final step in processing of 16S free 30S ribosomal subunits. It could be accessory protein needed for efficient assembly of the 30S subunit. It is needed in a step prior to rbfA during the maturation of 16S rRNA. It has affinity for free ribosomal subunits but not for 70S ribosomes (By similarity). SUBCELLULAR LOCATION: Cytoplasmic (Potential).

It is also useful for treating diseases associated with angiogenesis, abnormal cellular proliferation, preferably human cell proliferation (e.g., tumour, lesion or wound), angiogenesis or conditions associated with microorganism infection such as AIDS caused by HIV-1. It is useful for modulating cellular proliferation and angiogenesis by contacting mitogenic and angiogenic factor and determining regulation of cell proliferation. The present sequence is vascular endothelial growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           inactivates and oxidises a growth factor, angiogenic factor or a trar activator for replication of the microorganism. The compositions of the invention are useful for prophylaxis and treatment of conditions such as cancers of the breast, colon, renal, prostate, ovary, lung, brain, uterus, skin, embryo carcinoma, teratocarcinoma, germ cell tumour, osteosarcoma, fibrosarcoma, melanoma, angiogenic diseases,

CC treatment of conditions associated with abnormal cellular proliferation, CC angiogenesis or microorganism infection. The composition comprises an CC active portion of an inhibitor, preferably lygyl oxidase (LO) which CC inactivates and oxidises a growth factor, angiogenic factor or a transcactivator for replication of the microorganism. The compositions of CC activator for replication of the microorganism. The compositions of the invention are useful for prophylaxis and treatment of conditions of CC the invention are useful for prophylaxis and treatment of conditions of tumour, osteosarcoma, fibrosarcoma, retaratocarcinoma, germ cell CC tumour, osteosarcoma, fibrosarcoma, melanoma, angiogenic diseases, CC AIDS (acquired immune deficiency syndrome)-associated malignancies, CC other tumours and hyperplastic diseases with or without inflammation. CC It is also useful for treating diseases with or without inflammation CC (e.g., tumour, lesion or wound), angiogenesis or conditions associated with microorganism infection such as AIDS caused by HIV-1. It is useful CC microgenic and angiogenic factor and determining regulation of cell proliferation. The present sequence is vascular endothelial growth factor (VEGF) 206 C-terminal protein fragment. VEGF is a substrate of croduces their infection residues of VEGF by LO dramatically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition for prophylaxis and treatment of a condition associated with abnormal cellular proliferation, angiogenesis or microorganism infection, comprises active portion of an inhibitor, preferably lysyl

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     obtaining CDNA encoding bVEGF (164 amino acids from). The probes crepresented in AAQ10806 and -07 were used in the screening procedures. See AAQ10796 for bVEGF120 which is obtained by alternative splicing of this sequence, i.e. bases 342-473 (amino acids 115-158) are splicing of this sequence, i.e. bases 342-473 (amino acids 115-158) are splicing. The product can be used for angiogenesis and re-endothelialisation of inner vascular surfaces in wound healing, e.g. treatment of full-thickness wounds such as dermal ulcers, venous ulcers and diabetic ulcers, burns, in surgery, in balloon angioplasty and for the in vitro culturing of endothelial cells. Hybrid growth factors of PDGF and VEGF can exhibit a mitogenic profile between each factor and can be used for wound healing or as inhibitors of angiogenesis for e.g. preventing the growth of tumours.

CC VEGF analogues in which CYS residues are substd. are more stable. See also AAQ10791-93; AAQ10796-97; AAQ10806-08 and AAQ11099.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the PMS-like tyrosine kinase binding region (FLT-1). All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FLT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis is desired for treatment of an underlying disease state.
                                                                                                                                                                                                                                                                                                                                    Homo sapiens.

Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FTT-1). All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FTT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FTT-1 receptors. Compositions identified may be
02-AUG-1996;
25-AUG-1995;
                                         23-AUG-1996;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the PMS-like tyrosine kinase binding region (FLT-1). All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FLT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis is desired for treatment of an underlying disease state.

N.B. This sequence is not given in the specification, it was created from a claimed specified mutant of wild-type mature VEGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vascular endothelial cell growth factor variant - used to identify candidates having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding
                                                                                 06-MAR-1997.
                                                                                                                                                                                                                      Misc-difference
                                                                                                                                                                                                                                                                             Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                      Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAW31085-W31096 are vascular endothelial growth factor (VEGF) variant Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FIT-1). All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FIT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FIT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis is desired for treatment of an underlying disease state.

N.B. This sequence is not given in the specification, it was created from a claimed specified mutant of wild-type mature VEGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vascular endothelial cell growth factor variant - used to identify candidates having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FLT-1). All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FLT-1 receptors. Compositions identified may be
                                                                                                                                          Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FLT-1). All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FLT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis

                                                                                                                                                                                                                                                                                                                                                                                                                                         Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the PMS-like tyrosine kinase binding region (FLT-1). All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FLT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis is desired for treatment of an underlying disease state.

N.B. This sequence is not given in the specification, it was created from a claimed specified mutant of wild-type mature VEGF.
             Homo sapiens.
Synthetic.

                                                                                                                                   AAW31085-W31096 are vascular endothelial growth factor (VEGF) variants. Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FLT-1). All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FLT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis is desired for treatment of an underlying disease state.

N.B. This sequence is not given in the specification, it was created from a claimed specified mutant of wild-type mature VEGF.
                                                                                                               Sequence
